

## **OVAFISH**

### **Instructions for use**

#### **Concentrated isotonic solution for washing of salmon eggs prior to fertilization**

**Contains antibiotic (gentamycin sulphate).**

##### **Instructions for use:**

- Solution is to be prepared under room temperature.
- Concentrated solution (1 liter) has to be diluted in ultra pure water (9 liter) or equivalent quality in order to obtain (10 liters) final solution ready to use.
- While preparing rinse off the container thoroughly with the obtained solution.
- Do not use the concentrated solution without diluting it.

OVAFISH effectively combats the harmful effect of staining caused by stripping (mucus, blood, urine).

- Prior to fertilization, put 1 liter of eggs in a strainer.
- Immerse the strainer in a recipient containing 1 liter of OVAFISH solution at water temperature.
- After one minute, remove the strainer from the recipient.  
The impurities are collected in the strainer thus leaving the eggs totally unsoiled.

##### **Storage conditions:**

- Can be transported at room temperature as long as it does not exceed +35°C, avoiding direct sunlight.
- For extended period of time, store in the refrigerator at +2°C to +8°C.

##### **Shelf life:**

2 years from date of manufacture (manufacturing batch No. and date indicated on the label).
